Decade for Repositioning
of **Civil Registration and
Vital Statistics in Africa**
2017-2026

Status of digitization of CRVS systems in Africa (Preliminary Findings)

Roza Mamuye Bora

Statistics Department

African Development Bank

Content of presentation

1. Introduction
2. Methodology/Approach for the Assessment
3. Preliminary Results of the Assessment
4. Conclusions

Introduction

Context

- COM guidance and resolutions
- The need to improve data systems

What do we mean by digitization?

Increased use IT systems, the ability to convert paper-based systems into digital form, use of electronic tools to collect, transmit and store CR information

Objective

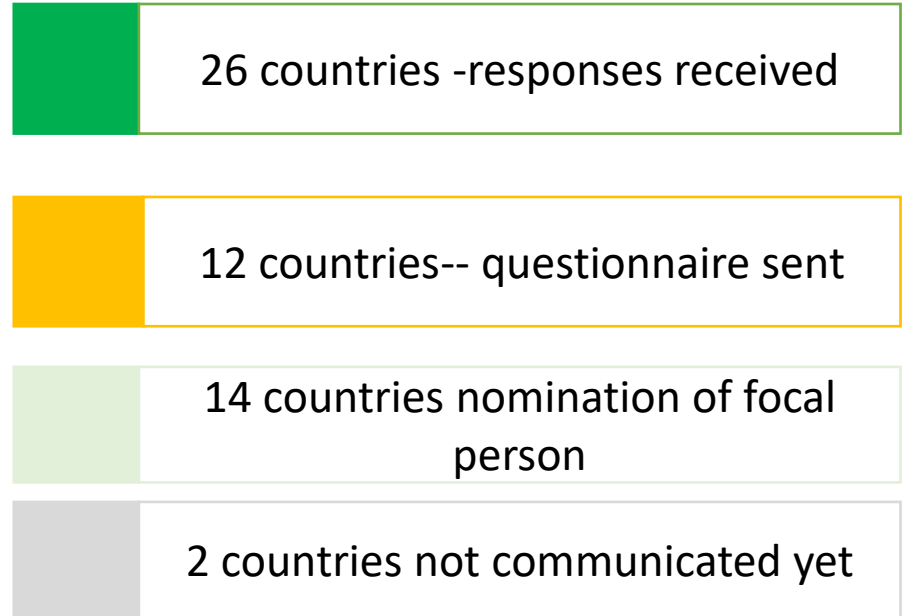

- Assess the status of CRVS systems with regards to digitization in terms of :
 - Capacity
 - Potential
 - Opportunities

Methodology – Data Collection

- Data collection is still in progress
- Electronic survey questionnaires were sent to CR offices
- Estimated time to complete the survey is 10 to 15 minutes
- The questionnaires were shared in three languages (English, French and Portuguese)

Methodology – Target Countries

All African Countries Targeted

Methodology – Questions Asked

- Are there legal frameworks to Support CRVS?
- Are there provisions to link CRVS with other databases?
- Does the country have computerized databases where CR records are maintained?
- Are there steps of the CR process that are digitized?
- Does the CR office in the country host its own data or outsources?
- What type of CRVS IT systems does the civil registration office in the country use?
- What are the existing initiatives that might inform the design of the digitized CRVS system?
- Capacity in terms of human resources, funding and infrastructure
- What are the Challenges/gaps?

Preliminary Findings- Legal Provisions

Including registration of vital events -
births, deaths, marriages, divorce (%)

Linking or interfacing with the other
databases (%)

Preliminary Findings- Digitization

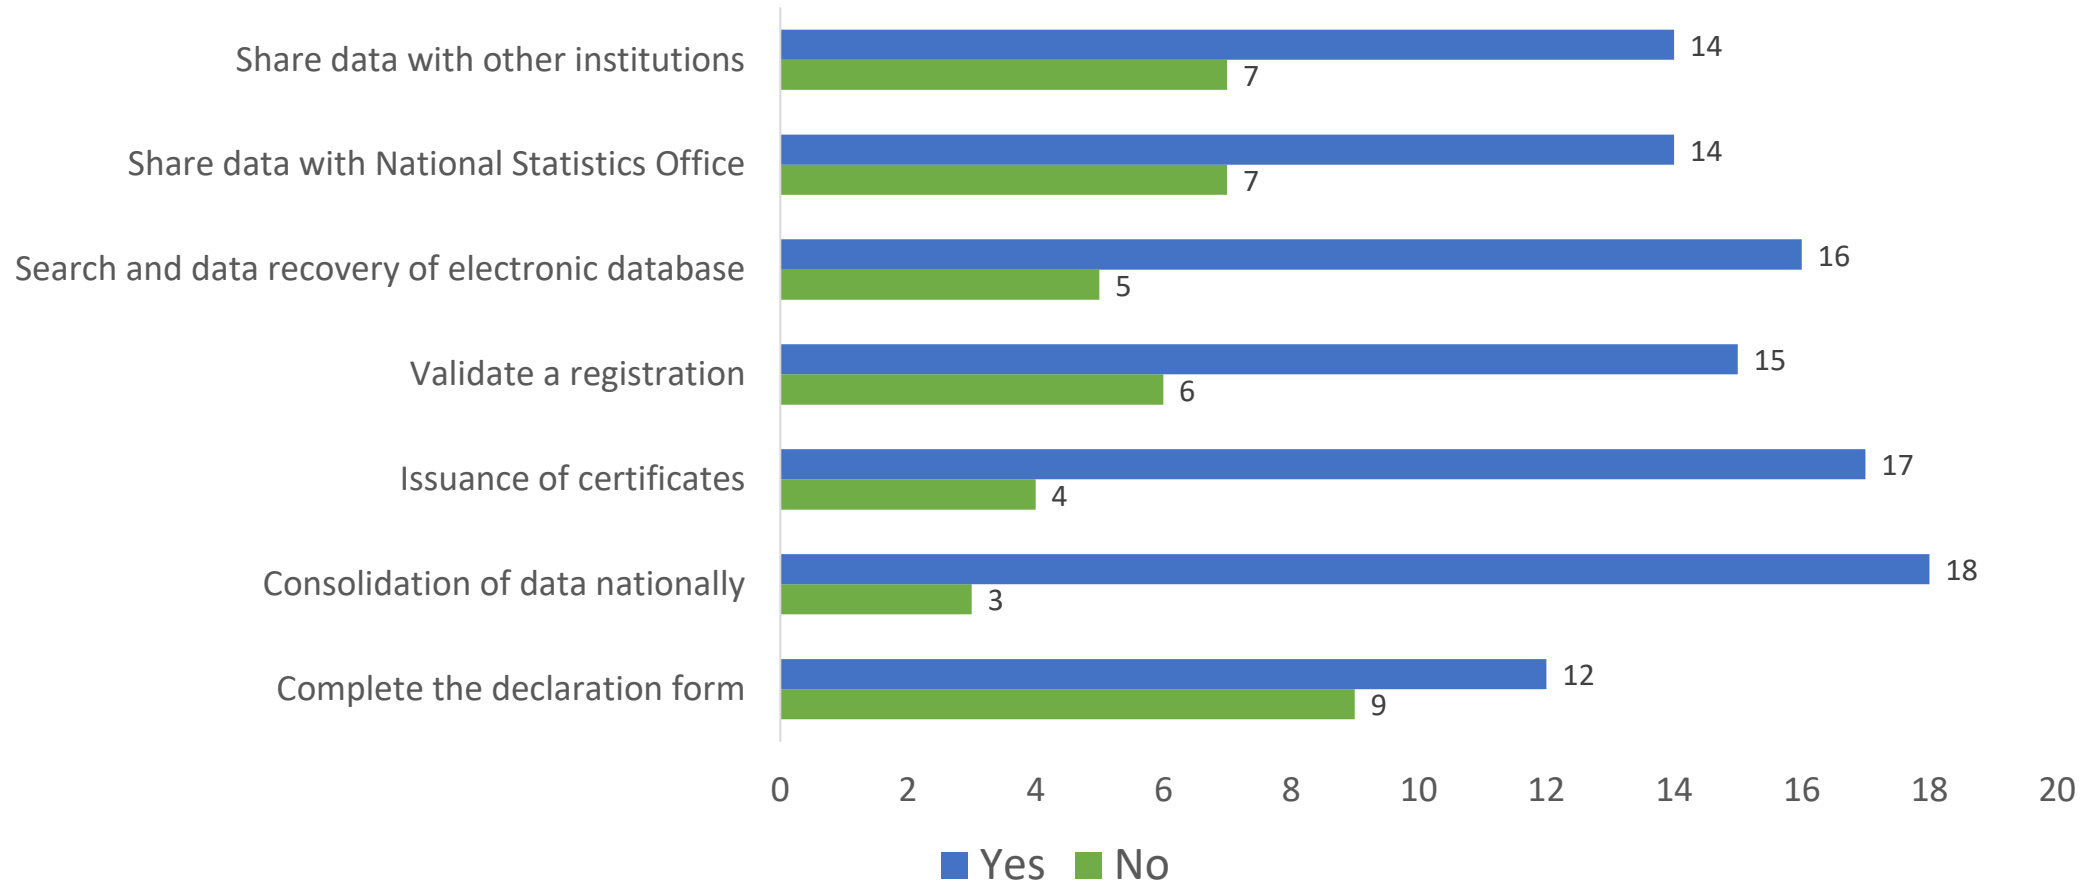

Existence of Computerized databases where civil registration records are maintained (%)

- Yes, only towns in the urban areas have electronic databases
- Yes, all civil registration offices countrywide have electronic databases
- The country has a national database
- No, only few offices in major cities have electronic databases
- No electronic CRVS database in the country

Preliminary Findings- Digitization

Steps of the registration processes that are digitized

Preliminary Findings: Digitization

Transmission of birth and death records from local and regional offices to a central storage- 53% electronic

| Mode of transmission | Countries (%) |
|---|---------------|
| All information is exchanged electronically | 52.5 |
| Paper copies are sent from local office | 9.5 |
| Paper copies are used throughout the system | 14.2 |
| The system is still mainly paper based | 23.8 |

Type of CRVS IT systems used by the civil registration office in the country -70.8% custom developed

| CRVS IT software | Countries (%) |
|--|---------------|
| Commercial off-the shelf software | 12.5 |
| Community-supported open-source software | 4.2 |
| Custom developed software | 70.8 |
| N/A | 12.5 |

Data hosting by civil registration office in the country – 70.8% self hosted

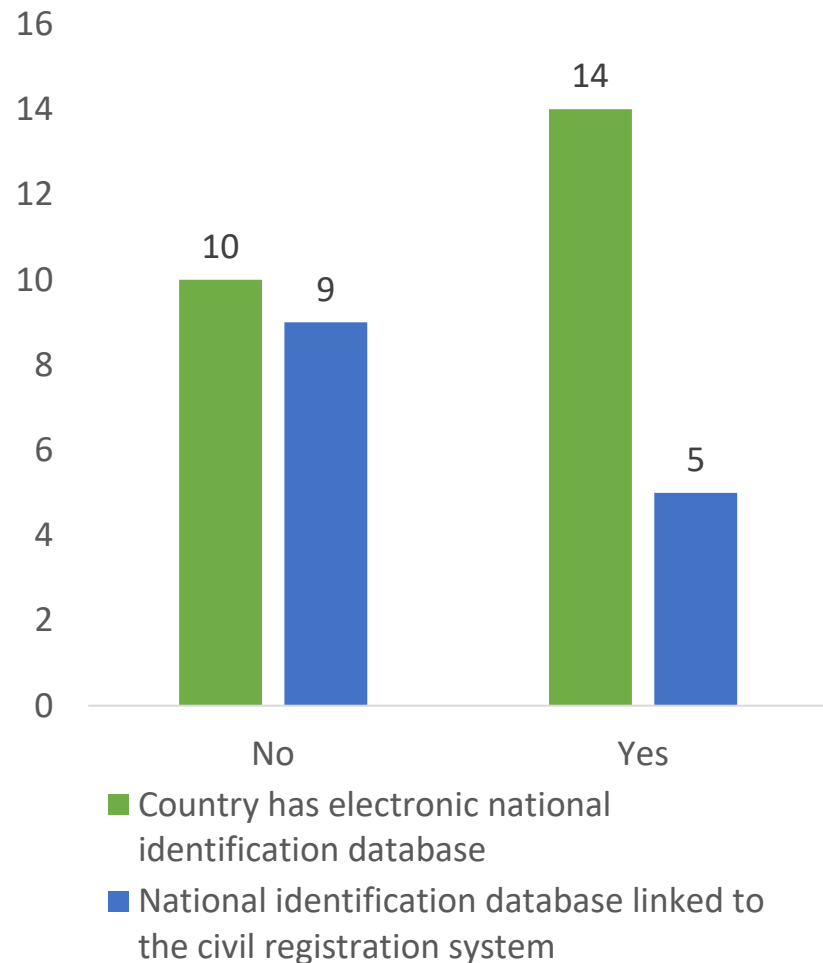

| Data Hosting | Countries (%) |
|--------------------|---------------|
| Outsourced system | 16.7 |
| Self-hosted system | 70.8 |
| N/A | 12.5 |

Software Capabilities

Preliminary Findings: Opportunities/Existing initiatives

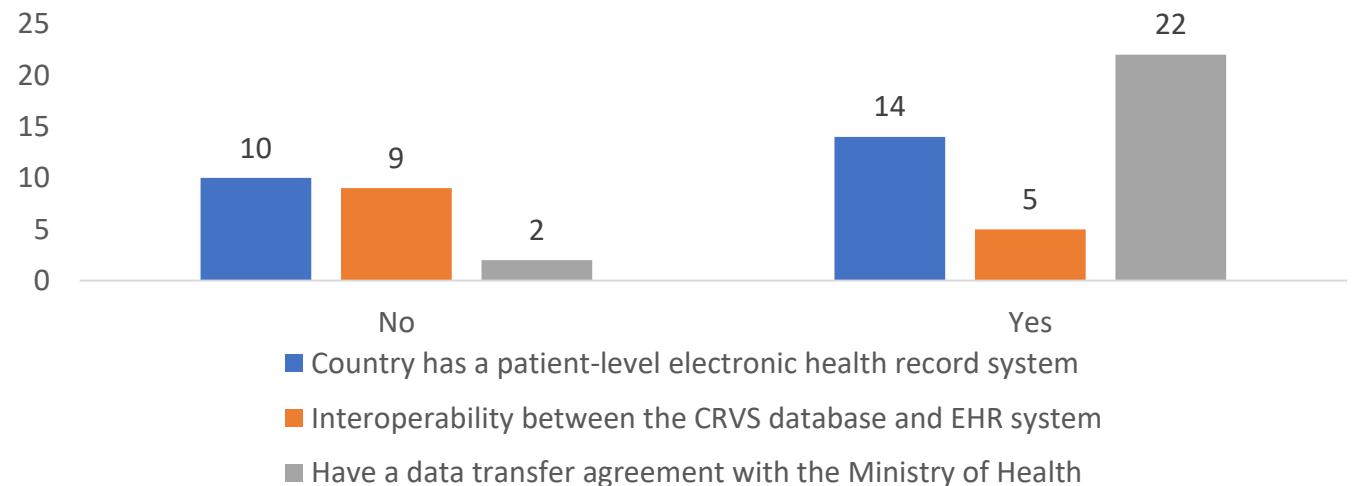

National identification databases-linkage to the civil registration system

e-Government technical infrastructure

Interoperability between the CRVS database and the patient-level electronic health record system

Preliminary Findings: Challenges/Gaps

Funding

Infrastructure

Legal Provisions

Human Resources

Does the Government provide adequate funding meant for any maintenance and upgrades required over the expected lifetime of the CRVS IT system? (%)

■ Yes ■ No

Legislation that has provisions for linking or interfacing with the other databases (%)

■ No ■ Yes

Does the civil registration office have dedicated staff members responsible for the management of the IT system? (%)

■ Yes ■ No

Conclusions

- Assessment is still ongoing-responses were received from 19 countries
- Gradual digitization process
- The digitization of registration processes for the consolidation of data nationally, issuance of certificates and validation of a registration appear to be more common, among the countries, than other registration processes
- Most countries have electronic databases for storing and maintaining vital events records
- There are scalable initiatives for interoperability, integration of systems
- Gaps exist in resources, capacity, infrastructure and legal provisions
- In depth study of various systems needed to identify a best practice

Thank You
