

STATUS OF CENTRAL AFRICA'S GREEN ECONOMY DEVELOPMENT CAPACITY

Central Africa has a huge potential of renewable natural resources. However, the economies of the sub-region are heavily dependent on exploitation of natural resources (oil, forests, mines, etc.) and consequently vulnerable to the exhaustible nature of raw materials and the volatility of their global-market prices. In spite of its potential, Central Africa is still far from a performance level that can permit it move resolutely towards achieving MDGs. To surmount such difficulties, Central Africa's development process stands to benefit from highly efficient management of its resources and improved growth resilience.
